In the Claims

Please amend claims 18-33 as follows:

- 1-17. (Withdrawn)
- 18. (Currently amended) A dynamically self-bootstrapping computing device comprising:

addressing means at the computing device for self-assigning an address for the computing device on an ad hoc network by selecting an address from a reserved range of addresses, pinging the selected address on the ad hoc network, and absent response to said pinging assigning the selected address to the computing device;

announcing means <u>at the computing device</u> for multi-casting an announcement message on a multi-cast communications channel of the ad hoc network informing of the computing device's assigned address;

discovery means <u>at the computing device</u> for listening on the multi-cast communications channel of the ad hoc network for a discovery message sent from a discovery client inquiring for a device type of the computing device;

discovery response means <u>at the computing device</u> for sending a response message responsive to the discovery message identifying the computing device; and

description means <u>at the computing device</u> responsive to a description request received by the computing device on the ad hoc network for sending a <u>peer-accessible</u> description message <u>dynamically</u> defining interaction via data messaging with the computing device to remotely operate the computing device over the ad hoc network.

- 19. (Original) The dynamically self-bootstrapping computing device of claim 18 wherein the description message further contains presentation data defining a user interface for remote presenting on another computing device for remotely operating the computing device over the ad hoc network.
- 20. (Original) The dynamically self-bootstrapping computing device of claim 19 wherein the description message further contains a link to style sheet data for defining separate views of the presentation data on said other computing device.

- 21. (Original) The dynamically self-bootstrapping computing device of claim 18 wherein the description message is formatted according to a mark-up language.
- 22. (Original) The dynamically self-bootstrapping computing device of claim 18 wherein the response message comprises a link to the description message.
- 23. (Original) The dynamically self-bootstrapping computing device of claim 18 wherein the response message comprises a device type identifier of the computing device.
- 24. (Original) The dynamically self-bootstrapping computing device of claim 18 wherein the computing device has a predetermined name, and the announcement message contains the predetermined name.
- 25. (Currently amended) A method of dynamically configuring a computing device, comprising:

self-assigning an address for the computing device on an ad hoc network by selecting an address from a reserved range of addresses, pinging the selected address on the ad hoc network, and absent response to said pinging assigning the selected address to the computing device;

announcing on a multi-cast communications channel of the ad hoc network the computing device's assigned address;

listening <u>at the computing device</u> on the multi-cast communications channel of the ad hoc network for a discovery message inquiring for a device type of the computing device;

sending a response message responsive <u>from the computing device</u> to the discovery message identifying the device type of the computing device; and

receiving a description request message <u>at the computing device</u> responsive to the response message; <u>and</u>

Page 3 of 11

responding <u>from the computing device</u> to the description request message by sending a <u>peer-accessible</u> description message <u>dynamically</u> defining interaction with the computing device to control operational functions of the computing device over the ad hoc network.

- 26. (Previously presented) The method of claim 25, further comprising terminating the interaction with the computing device to control operational function of the computing device.
- 27. (Previously presented) The method of claim 25 wherein the description message further contains presentation data defining a user interface for remote presenting on another computing device for remotely operating the computing device over the ad hoc network.
- 28. (Previously presented) The method of claim 27 wherein the description message further comprises a link to style sheet data for defining separate views of the presentation data on said other computing device.
- 29. (Previously presented) The method of claim 25 wherein the description message is formatted according to a mark-up language.
- 30. (Previously presented) The method of claim 25 wherein the response message comprises a link to the description message.
- 31. (Previously presented) The method of claim 25 wherein the computing device has a predetermined name, and the announcement message contains the predetermined name.
- 32. (Previously presented) The method of claim 25, wherein sending a response message responsive to the discovery message further comprises identifying the address assigned to the computing device.

Page 4 of 11

- 33. (Previously presented) The method of claim 32, further comprising specifying a device-specific protocol of data messages for interacting with the computing device.
- 34. (New) The dynamically self-bootstrapping computing device of claim 18, wherein the description message defining interaction identifies a protocol to interact with the computing device and defines a data packet to exchange control information
- 35. (New) The method of claim 25, wherein the description message defining interaction identifies a protocol to interact with the computing device and defines a data packet to exchange control information.
